

24-hour urine sample collection (dU-)

Test for which the collection is carried out: _____

Collection container

You can get the collection container from your medical care unit, or you can pick it up from the nearest service point of ISLAB.

Storing

When a urine sample is stored, chemicals and bacteria quickly start multiplying in the sample, which may impact the test results. Therefore, the tops of the collection containers must be screwed shut tightly and **the collected sample be stored in cold environment (refrigerator temperature) throughout the sample collection process.**

Start of sample collection

Empty your bladder. Do not collect this sample.

Write down this time, which is the start of the urine sample collection at the same time:

Date: _____ hour: _____ (10 minutes precision)

After that, collect all urine into the collection container every time you urinate. Keep the container in a cold place. If one container is not enough, continue collecting into another container.

End of sample collection

Collect the last urine sample exactly 24 hours from the beginning of collection. The collection ends here.

Write down this time (end of collection):

Date: _____ hour: _____ (10 minutes precision)

Write your name and personal identity code on the collection container and this form:

Name: _____

Personal identity code: _____

Keep the collection container in a cold place and take it to the laboratory as soon as possible after termination of the sample collection. The container can be taken to the laboratory at room temperature. Take this urine sample collection instruction to the laboratory together with the sample.

Let the person collecting the sample know if you were not able to follow these instructions or if you were given other kinds of instructions.

If you have any questions regarding the sample collection, please contact ISLAB's customer service by calling tel. 044 457 0740.

Your own doctor or nurse will answer any questions you may have about your tests and results.
